

A Thermodynamic Equation of State for the Critical Region of Ethylene

A. Abbaci^S and A. Berrezeg^C

Faculté des Sciences, Department of Chemistry, Université Badji Mokhtar, Sidi-Ammar, Annaba, Algeria

A fundamental equation of state is developed that describe the behavior of the thermodynamic properties of ethylene in the vicinity of the critical point. Specifically, we present a crossover equation of state that takes account not only the scaling laws at the critical point but also the analytical behavior far away from the critical point. Analysis of different sets of data for the thermodynamic properties is made.
